New Emissions Factors Available

Instructions to update your ClearPath records

Hi everyone,

Thanks for using ClearPath for your GHG inventorying and climate action planning needs!

We wanted to announce that new electricity emission factors for 2016 and 2017 are available for PG&E and SCE. These are published through Climate Registry and the SCE Sustainability Report. **We are tracking all of the emission factors we know of in [this spreadsheet](#).**

if you know of other emissions factors we are missing, please email us at iclei-usa@iclei.org.

Instructions to update your records: We have uploaded these new factor sets into ClearPath already for you. However, further action may be needed. Some of you already have been using previous years' data from either PG&E or SCE as proxy while we were waiting for the published emission factors. When you log into your inventory, you will now see a new emission factor dropdown in the electricity calculators labeled "Default IOU 2016 or 2017". If you already have existing inventories in ClearPath, you will need to go into each calculator and select this new emission factor and save the record.

We recommended you delete any proxy emission factors and other emission factors from IOUs that do not serve you to reduce possibility of confusion for users. For example, if you are in PG&E territory and had a manually entered 2017 proxy emission factor using 2016 data as well as the new default from SCE for 2017, you can delete the proxy and SCE emission factors.

å

Sincerely,
ICLEI USA
