West Berkeley Library

# Berkeley Public Library

- Main Library and four branches
- 1.1 million annual visits
- 1.76 million checkouts annually (19.25 per capita)
- 140,000 square feet of conditioned floor space
- ~\$14 million expenditure budget
- ~\$220,000 annual energy expenses

## City Of Berkeley Policy Drivers

- **2009 Climate Action Plan Adopted**
  - **33% CO2 reduction below 2000 level by 2020**
  - **LEED Silver for all construction and renovation**

## Measure FF – Berkeley Public Library Bond

- \$26M bond authorized by voters in 2008 for branch library improvements
  - Seismic
  - ADA improvements
  - Physical space and operations improvements

# Procurement

- RFP for West Berkeley design team in 2009:
- Proposal from Harley Ellis Devereaux/Green Works Studio
  - Referenced City policies
  - Referenced National 2030 Challenge and CA NZE Policy
  - Proposed ZNE building
  - Proposed leveraging incremental design cost

**HARLEY ELLIS DEVEREAUX**

***Pacific Gas and  
Electric Company®***

**GREENWORKSSTUDIO**

## **ZNE Team Effort**

- **Savings By Design program**
  - Provided design assist grant
  - It is not meant to cover the entire cost of ZNE analysis
  - Design effort far exceeded the grant
- **ZNE Pilot Program**
  - Case study for PG&E ZNE pilot program
  - PG&E tracked design effort and assisted with final EnergyPro modeling for LEED and Title 24

# Budget Impacts

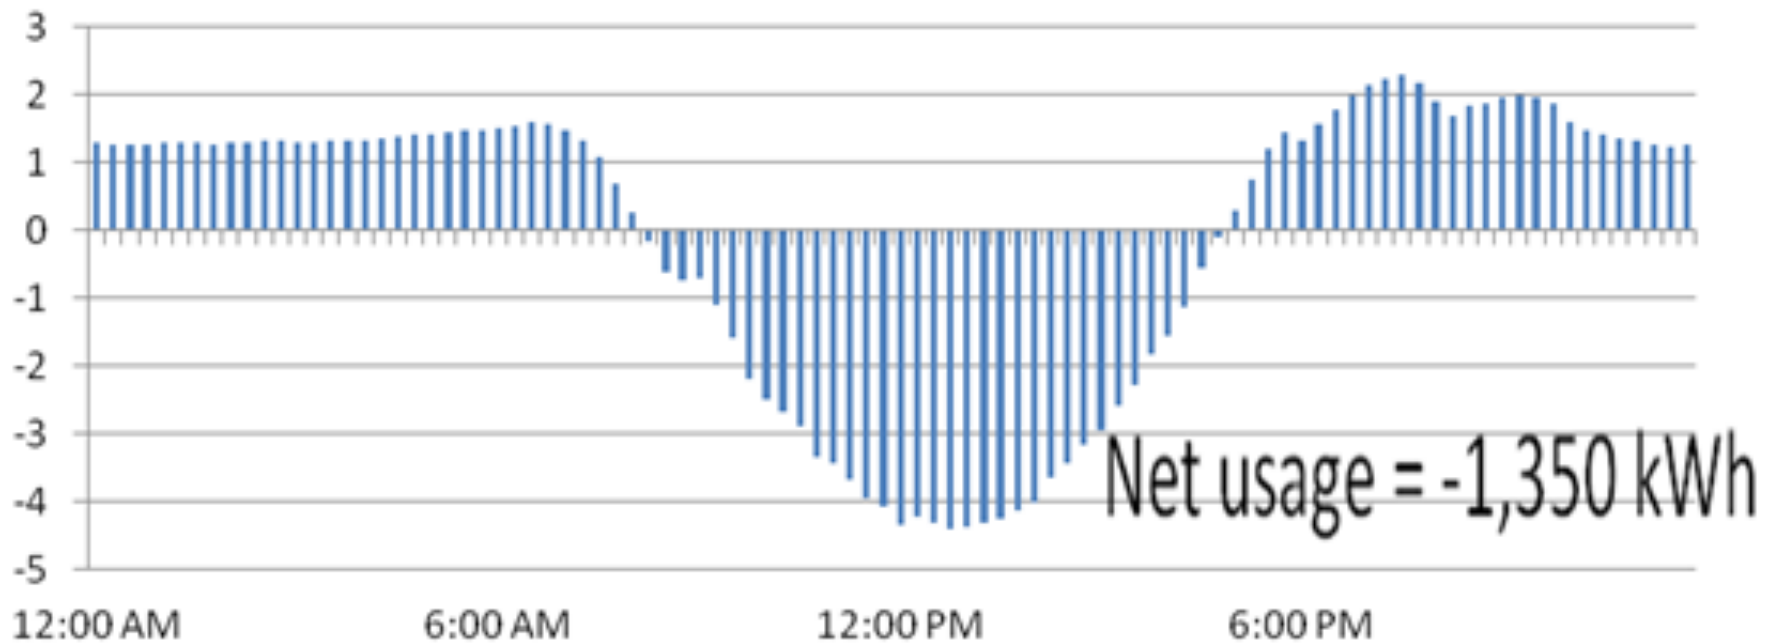

- \$7.5 M total budget
- \$60,000 incremental ZNE design cost
  - Offset by PG&E Savings by Design
- ~\$250,000 incremental ZNE capital cost
- Initial cost estimates over budget
- Options
  - Considered CEC loan
  - Considered dropping solar

## Building Metrics

### Average kWh @ 15 min Intervals January - May 2014

# Building Metrics

## kWh Intervals, May 1-2

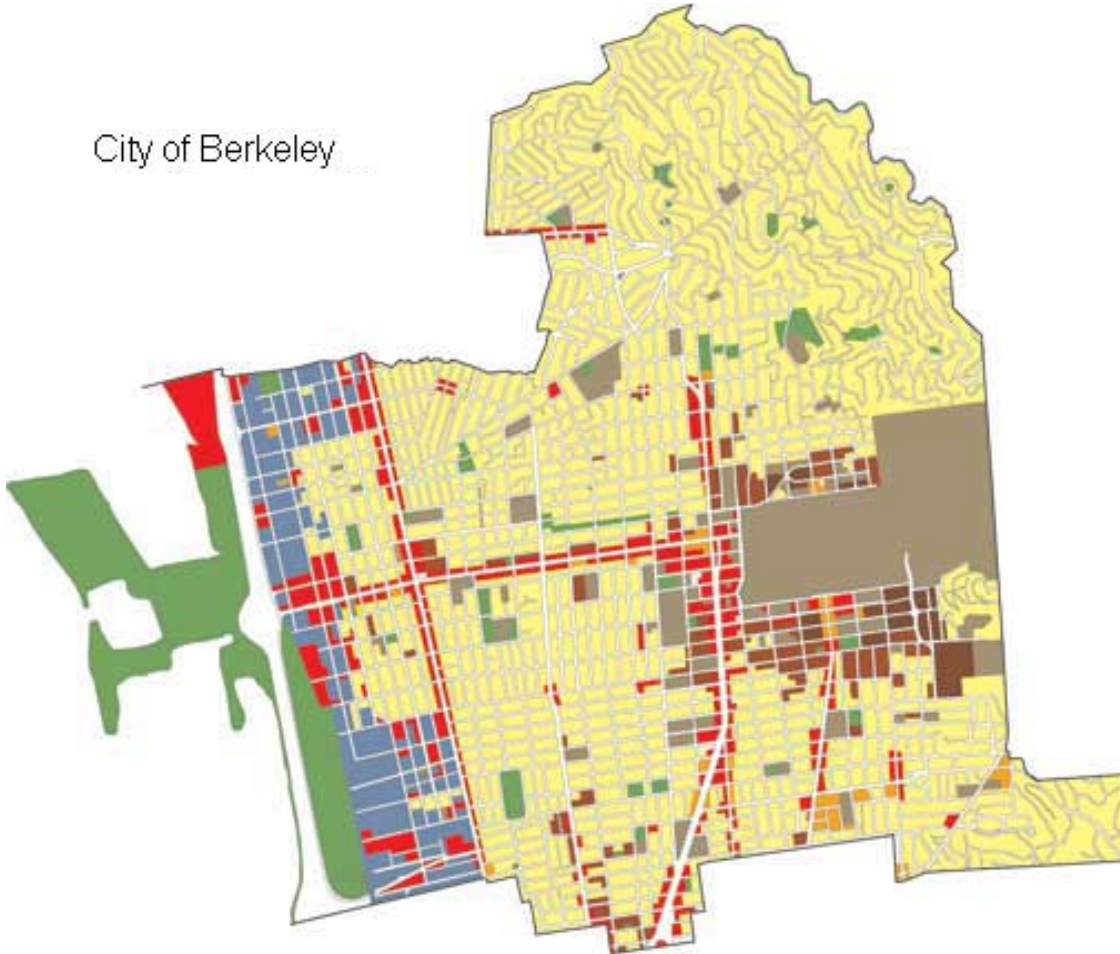

# City of Berkeley Lessons Learned

City of Berkeley

- **Climate Action Plan and LEED policy drivers were critical**
- **A Need for Institutional Improvements**
  - Relied too heavily on favorable bid
- **Policies For Consideration**
  - Life Cycle Cost Analysis requirements
  - Leverage projected O&M savings into capital budget
  - Mitigation/Offsets for expansions
- **Measurement is Critical (and not that easy)**

Building Section

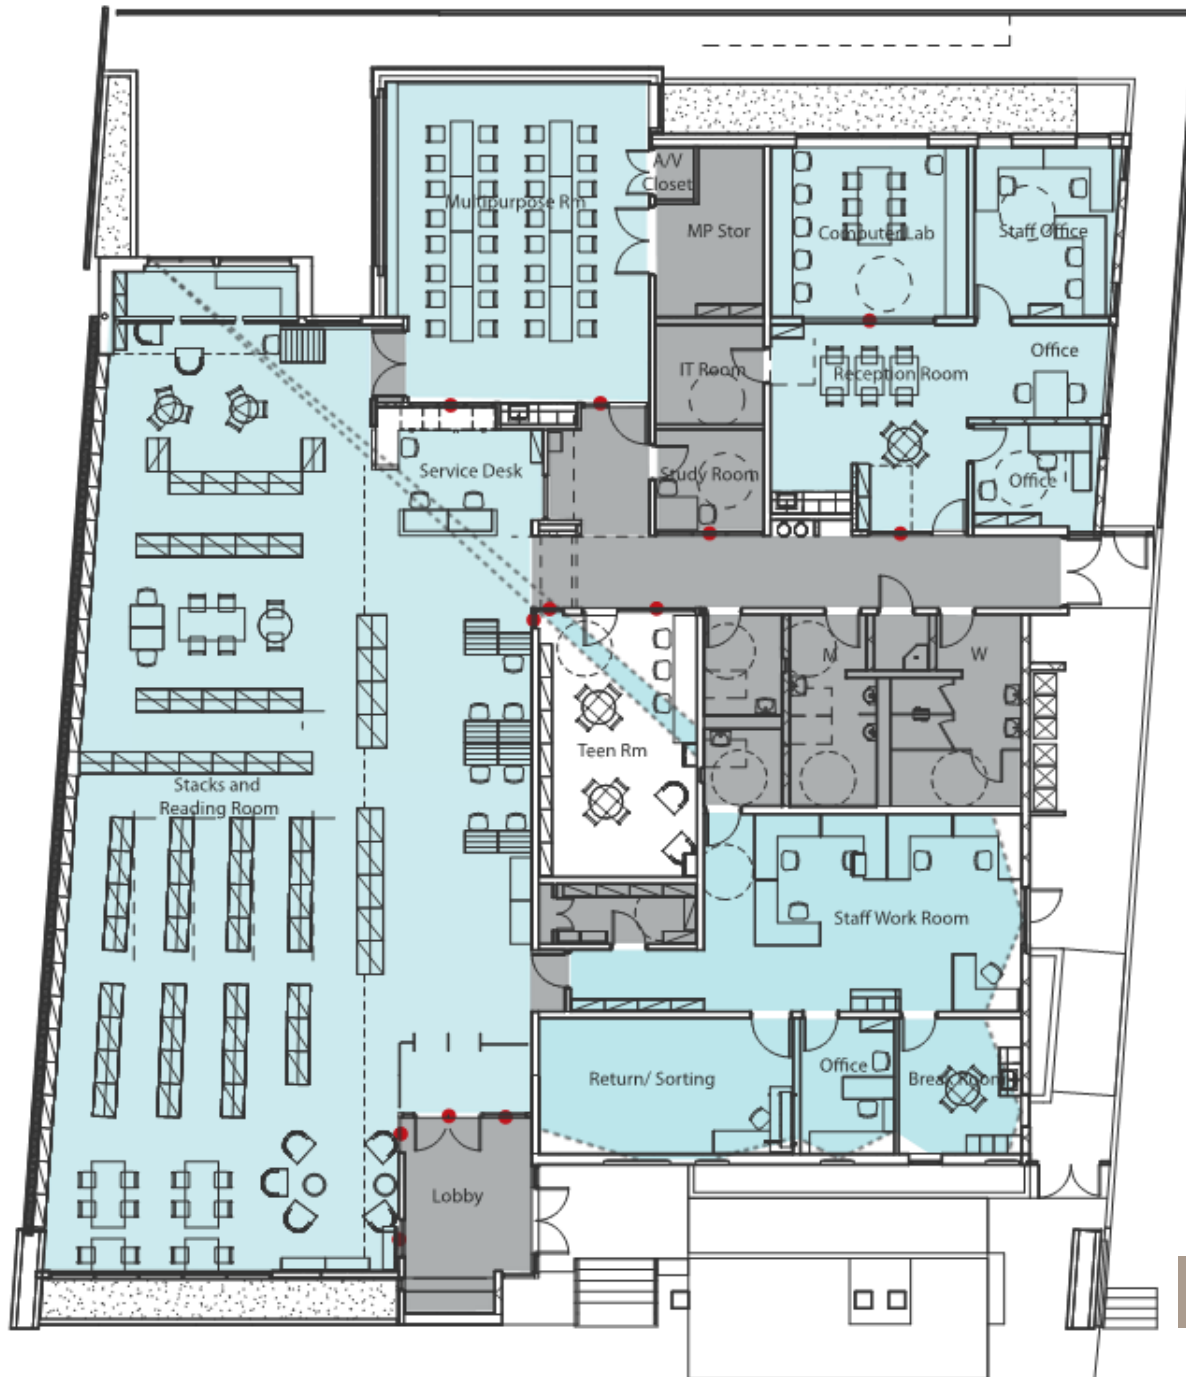

## Day Lighting Design Tools

- Daysim- annual daylighting analysis with weather data
- Radiance – illuminance maps based on specific times
- Use the right tool
- Daysim was more user friendly in early design phases

Daylight Modeling

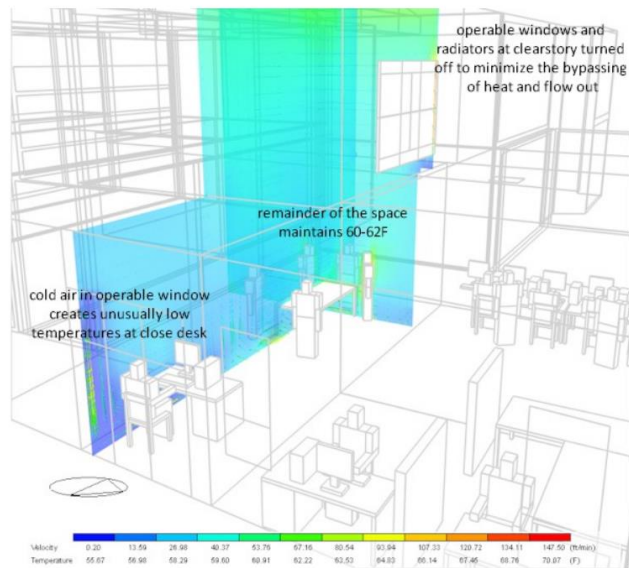

- Area with no views
- Area with views 90%
- Non-regularly occupied areas
- Interior Glazing

## Natural Ventilation – Computational Fluid Dynamics (CFD) Studies

- Fluent (Ansys Airpak)
- Various ceiling configurations and shapes were analyzed
- CFD analysis indicated - horizontal ceiling plane works as well as a sloped ceiling
- Comfort Verification Studies – Additional CFD analysis was done during late design for verification purposes

Comfort verification studies by Capital Engineering/ SEED Inc.

Natural Ventilation Analysis

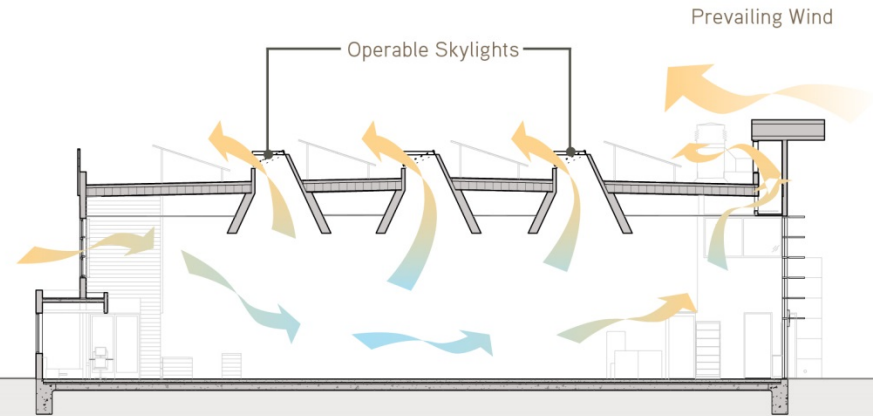

-  Book Stacks
-  Multipurpose Room
-  Office Area
-  Janitor and Restrooms
-  Teen Room
-  Staff Area
-  Wind Chimney
-  Skylight
-  Operable Skylight
-  Air Inlet
-  Sound Trap (Wall or Ceiling)
-  Direct Opening
-  B.A. Fan
-  Fan
-  Clerestory Window
-  Exhaust Fan Unit
-  Ceiling Exhaust Grille to Air Chase

Floor Plan – Ventilation Systems

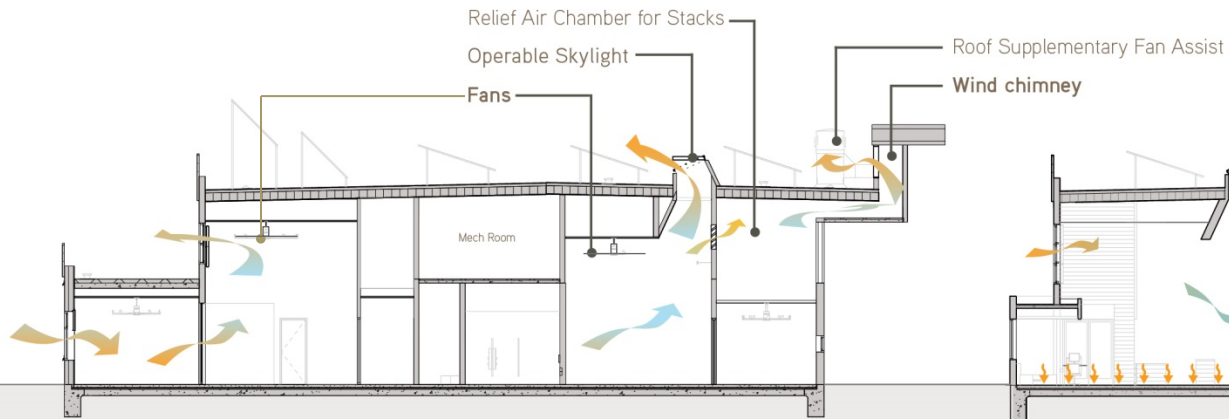

Heating Season

Early Cooling Season

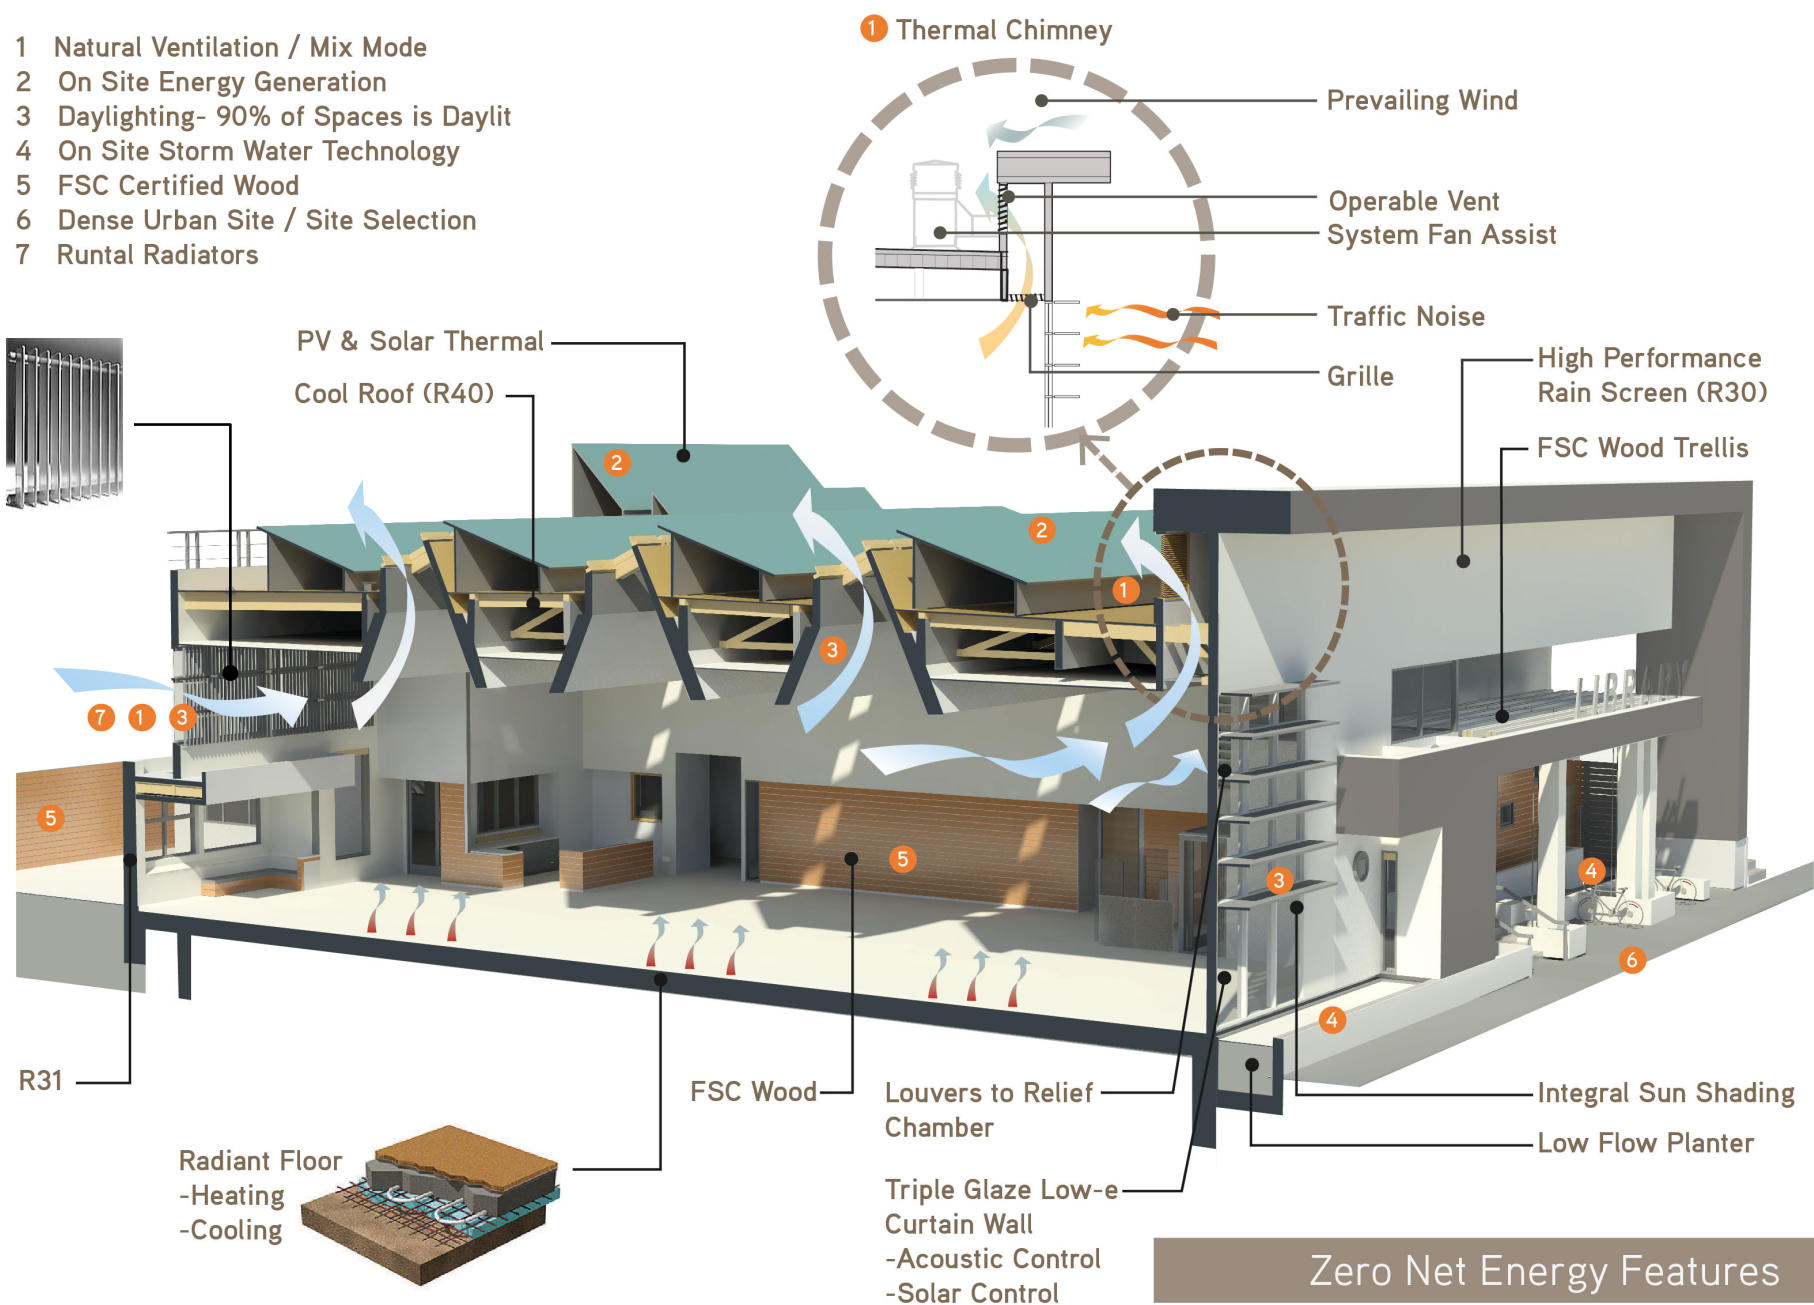

Cooling Season

Peak Cooling Events

Mixed-Mode Operating System

- 1 Natural Ventilation / Mix Mode
- 2 On Site Energy Generation
- 3 Daylighting- 90% of Spaces is Daylit
- 4 On Site Storm Water Technology
- 5 FSC Certified Wood
- 6 Dense Urban Site / Site Selection
- 7 Runtal Radiators

## Energy Utilization Rate Comparison

Baseline Building (Title - 24): 104 kBtu/sf/year

West Berkeley Library: 25 kBtu/sf/year

Whole Building Energy Analysis

West Berkeley Library

## Public Procurement – Lessons Learned

- Few Built ZNE public Buildings
- FEAR of unknown is a hurdle
- Recall early days of LEED with 30% premium projects
- Costs Estimates may not be reflective of true costs
- There are ZNE and then there are ZNE projects
- HED relied on proven and reliable technology
- Passive Design has been around for centuries

Public Low Bid

## Public Procurement – Lessons Learned

- Public Low Bid Requirement
- Limited Number of General Contractors with ZNE Experience
- Has to be a Collaborative Process
- Project Kick Off is Key
- PM/CM/PA/Builder/ Client Relationship is Crucial
- PA Needs to Educate
- PA Needs to Collaborate and Develop Trust
- COMMUNICATION!

Public Low Bid

- Coordination
- Quick turn around on RFIs/ Submittals
- Be Flexible
- Work as a Team to Identify Savings and Opportunities
- Concepts that apply to all projects

|              |                                     |
|--------------|-------------------------------------|
| Policy       | City of Berkeley/ Project History   |
| Design       | Site Location                       |
| Design       | Maximum Energy Production Site      |
| Design       | Passive Strategies                  |
| Design       | Integrated Holistic Form            |
| Construction | Contractor and ZNE Building         |
| Construction | <b>Photovoltaic System and Roof</b> |
| Construction | Radiant Slab (Heat + Cool)          |
| Construction | Natural Ventilation                 |
| Construction | Day Light                           |

|              | Project Team / Credits              |

West Berkeley Library

## Unseen But Important -Roof

- Basis of Design/  
Performance  
requirements
- PV Subs want to  
Install Off the Rack  
Systems
- Be Aware of System  
Conflicts
- PA Needs to Resolve  
Issues, Find Solutions  
and Be Aware of ZNE  
at all times
- Integrated Designs  
Are Not Friendly  
Towards Field  
Changes

Lessons In The Field

## PV & Solar Thermal

- Learning curve
- Not your standard electrical/mechanical room
- Plan for issues in the field where Design Build systems are concerned
- Structure needs to have factored in design load
- PV emergency shut off -within 10' of Main Switch Gear (MSB)
- Clearances?

Lessons In The Field

## PV & Solar Thermal

- Do not exceed zoning height limitations
- Low slope roofs – HED detailed for stanchions.
- Standard wood curbs preferred by subs can impede flow and affect collector plate angles
- Stanchions allow for future technology, reroofing, ease of maintenance.

Lessons In The Field

## PV & Solar Thermal

- Structure needs to be conservative to accommodate solar thermal
- Review of submittals from joist and solar thermal should be concurrent
- Collector plate dead and live loads
- Scrutinize the performance, efficiency and proposed angles of collectors in submittals

Lessons In The Field

|              |                                   |
|--------------|-----------------------------------|
| Policy       | City of Berkeley/ Project History |
| Design       | Site Location                     |
| Design       | Maximum Energy Production Site    |
| Design       | Passive Strategies                |
| Design       | Integrated Holistic Form          |
| Construction | Contractor and ZNE Building       |
| Construction | Photovoltaic System and Roof      |
| Construction | <b>Radiant Slab (Heat + Cool)</b> |
| Construction | Natural Ventilation               |
| Construction | Day Light                         |
| Construction | High Performance Envelope         |

|              | Project Team / Credits            |

West Berkeley Library

## Radiant Slab

- Triple Wall Radiant Tubing
- 4" of Radiant Concrete Slab over 2" of Rigid Insulation
- Engineer has to check manifold design and tubing layout to ensure proper zoning
- Template Layout -avoid punctures
- Educating the **other** subcontractors is **KEY**
- Install protection plates under doors or at penetrations

## Radiant Slab

- Tight Urban Site provided no laydown space.
- Everything is stored within the building.
- Slab pours -carefully phased to allow materials to be relocated
- 6" concrete curbs at all interior partitions
- Curb cutouts need to be planned for manifolds and for construction access- cherry pickers, etc.

|              |                                   |
|--------------|-----------------------------------|

|              | Project Team / Credits            |

West Berkeley Library

## Natural Ventilation

- Interior of chimney has to be lined with acoustic board
- Provide for access to service and maintain
- Patrons standard comment is usually about how quiet the building is!
- CFD studies were worth it. No discomfort reported

## Natural Ventilation

- Operable windows are tied to BMS
- Some manual operable windows provided at staff offices
- Window actuator looks like a handle – one operable window at standard height broken by patron
- Runtal missed at one automatic window

Wind Chimney

## Runtal Radiators

- Provides preheating of fresh air in the winter
- Long lead time 6-8 weeks
- Concerns about appearance and perception
- Standard Runtal heights are limited
- HED worked with fabricator to increase fin spacing & revised pressure and flow design

Runtal Radiators

EXIT

West Berkeley Library

## Skylights

- Abundance of light-covered up skylights during construction
- Note the Roxul- rock wool insulation
- Note the radiant tubing layout over rigid insulation
- Layout of floor boxes
- Note the construction lights

Day Light

## Skylights

- Both fixed and operable
- Operable skylight controls were difficult to get to communicate with BMS
- Value engineering exercise had removed integral blinds- added back during construction
- Skylight blinds have solar cell- self powered and automatic

Quality of Light

West Berkeley Library

- High Performance Rain Screen System
- 14 Week Lead time from Switzerland – No comparable local product
- HED arranged for contractor to obtain manufacturer certification
- HED revised details to reduce steel furring use by 30%
- Reduced material use, errors, labor and possibility for breakage during installation

Cement Composite Panel Rain Screen

- Attention to detail at intersections of different assemblies
- Crucial during field work
- Care on the part of the GC is just as important
- Shout out to Pat Chavez & Paul Ubaldi- WBB Project Engineer & Site superintendent/ carpenter

Cement Composite Panel Rain Screen

- 3x8 wood studs @ 24" on center
- Wood is thermally efficient vs. steel stud
- 7 1/4" of wall cavity filled with rock wool insulation = R30
- 2 layers of Roxul in roof/ ceiling = R41
- 5 week lead time from Canada
- Good acoustics, high thermal & hygrothermal
- performance, fire protection, moisture & mold resistant and will not sag

Roxul Rock Wool Insulation

- 1" x 6" Radiata pine siding impregnated with resin
- FSC, dense, mold and insect resistant, weathers well – alternative to tropical hardwoods
- Designed as a rain screen system
- Dreamdex is restructuring – product unavailable
- City purchased available stock at start of construction and kept off site
- HED worked with contractor to avoid wastage

DreamDex Wood Siding

\$17.59/sf premium

\*1 - includes \$700,000 owner related increases. There are efficiencies in larger buildings; and typically cost per square feet will appear lower.

\*2 - As of August 2013 as approved by city council- construction is ongoing.

\*3 - Existing building with 380sf addition-interiors only

\*4 - Existing building with 4,000sf two storey addition

\*5 - Final project costs of \$6.5M includes FF&E.

Did you know?

In addition to providing natural light, skylights also provide natural cooling by allowing the warm air to exhaust outside when open.
